

VDA4 cross-attention dynamics · high decay versus standard
Primary high–standard motion difference = -0.0995 (paired 95% bootstrap CI -0.1021, -0.0970)

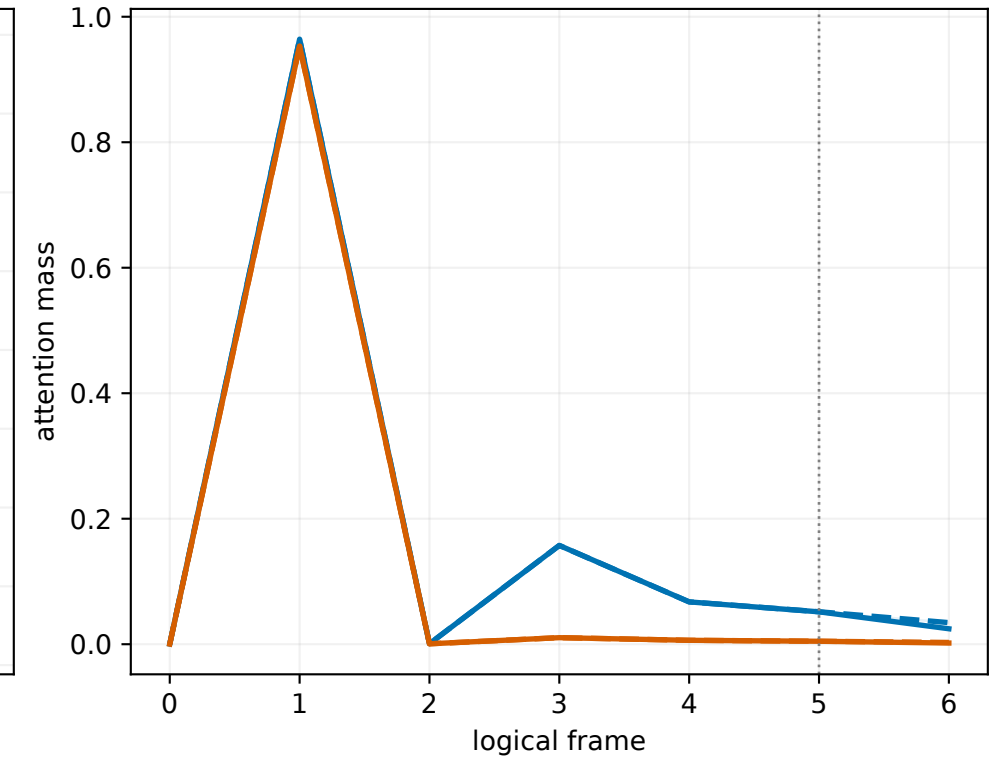

A Temporal attention motion (primary)

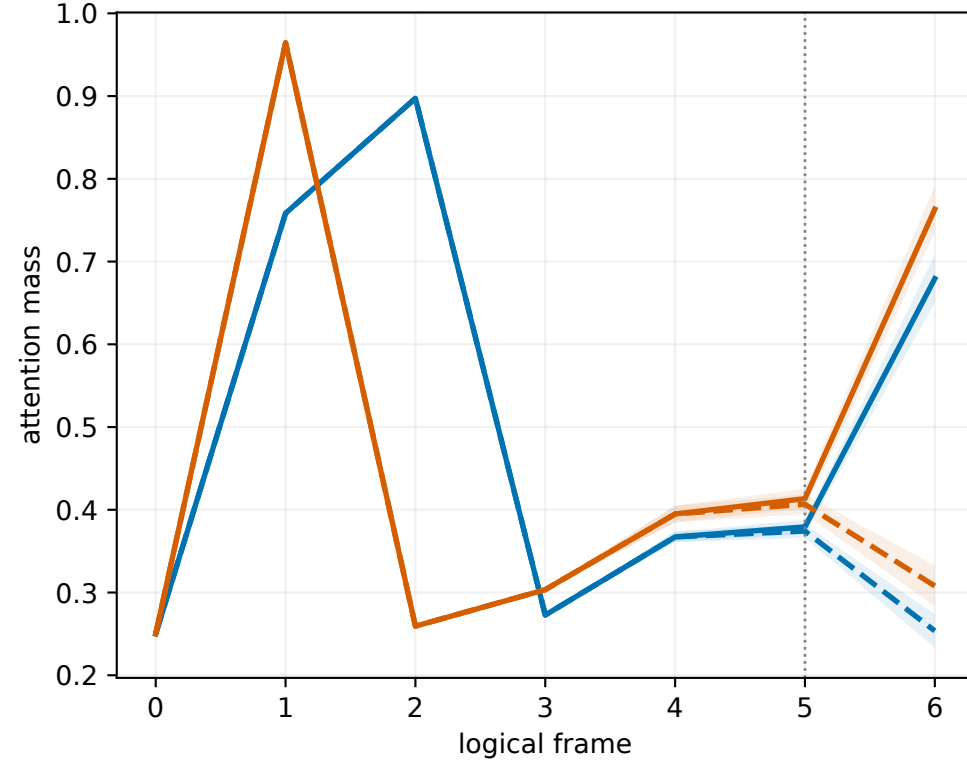

B Attention selectivity (1 – normalized entropy)

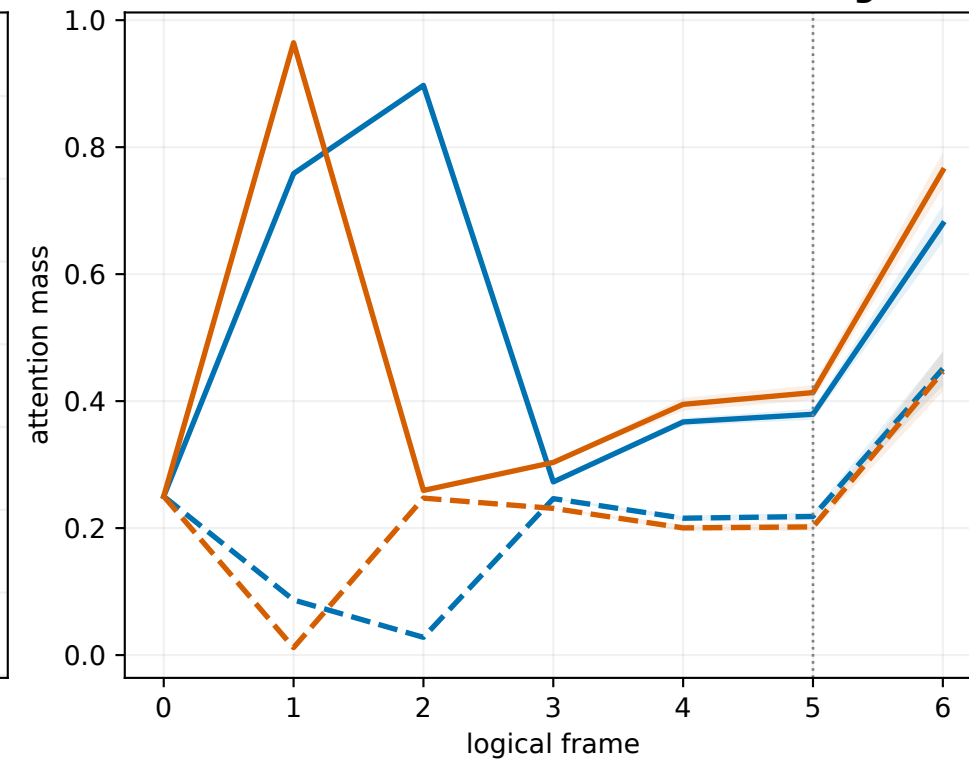

C Image-key source mass

D Combined attention to cued S1

E Combined attention to condition change location

F Change-location attention by qualifying response
