

VDA4 crossattn1 -- paired attention manipulation on invalid trials (18° focal change, cue at S1, forced change away from cue)

Each curve targets the additive key-logit bias at a different location while the trial itself (cue at S1, physical change forced away from the cue) is held fixed; positive bias boosts, negative bias suppresses. Error bars omitted for readability; n=300 trials per point from one checkpoint, not training-seed uncertainty.
